

Pierce County let a project
February 8, 2010, for
placement of six-inches of
PCC Concrete Overlay against
an asphalt alternative.

After analyzing the bids, the
County discovered the cost of
the six-inch PCC would be less
than an equal-thickness asphalt
overlay. They opted to go with
longer lasting, durable, and

environmentally-
friendly
Concrete.

think
harder.
think
concrete.

In this era
of short funding for
county roads, it is ever
more important to get
the most value for the
dollars spent.

**Providing Great Value
is where PCC concrete
overlays shine.**

North First Street before the concrete overlay.

A & R Construction from Plainview, Nebraska was the low bidder at \$267,647.87 for the one mile section on North First Street. A change order adding earth shouldering, seeding, and mulch for about \$35,500 raised the final cost to about \$303,000.

The project was completed in two days. This allowed access to properties along the roadway during construction.

The annualized construction cost of the 25-year PCC overlay is \$12,040 per year, compared to a four-inch thick asphalt annualized cost of \$16,875 for 15 years. A six-inch Asphalt overlay would cost about \$25,000 per year. And the asphalt takes more maintenance!

Here is a case of getting a longer lasting road needing **less maintenance for fewer dollars per year!** *And Lower Initial Cost, too!*
